

For each word: write the definition AND give a numerical example that shows what it means.

1. Work out each addition. Show the column method AND use subtraction to CHECK your answer:

2. Find the MISSING NUMBER. Show how you worked it out:

3. A student says: $247 + 135 = 372$. Use the column method to check whether this is correct. Show ALL your working clearly, step by step. If they are wrong, explain exactly which step they made a mistake in.

4. Explain in your own words what "carrying" means and WHEN it happens. Draw a column addition example that requires carrying in BOTH the ones column AND the tens column. Label each carry clearly.

5. A school library has 347 fiction books. It receives a donation of 256 more fiction books and 128 non-fiction books. (a) How many fiction books does it have now? (b) How many books altogether? (c) If the library can only hold 800 books, how many books over the limit is it? Show ALL working.

6. REASONING: Without calculating, explain how you know that $487 + 364$ MUST give an answer greater than 800. Use the words "hundreds," "tens," and "ones" in your explanation.
