

For each plant part: write what it does AND explain it using an analogy (comparison to something familiar). Example: "The stem is like a drinking straw because it carries water upwards to the leaves."

1. A student grew FOUR plants. Each plant was given everything it needed EXCEPT one thing. Study the results:

2. Put these stages of a plant's life in the correct order. Write 1–5:

3. Photosynthesis is described as the most important process on Earth — not just for plants, but for ALL living things. Explain why. Think about: what plants produce during photosynthesis that animals need, and what would happen to all animals if plants stopped.

4. The leaf is sometimes called the "kitchen" of the plant. Explain this analogy in detail. What are the "ingredients" it uses? What is the "recipe" (process)? What is the "meal" it produces? What would happen to the plant if you removed all its leaves?

5. DESIGN A FAIR TEST: You want to find out if plants grow taller when given MORE sunlight. Complete the plan:
